

IMPORT DATA USING TRANSFORM MAPS (SPREADSHEET)

PHASE 1 – BRAINSTORMING & IDEATION

1.1 Introduction

The brainstorming and ideation phase establishes the foundation of the project by identifying a practical problem and defining an appropriate solution. The project is based on a common enterprise requirement in which employee information is maintained in an external spreadsheet but needs to be available in ServiceNow for centralized management.

1.2 Problem Identification

Manually entering employee records into ServiceNow can be time-consuming, especially when handling a large number of records. Manual entry may also result in typing errors, inconsistent values, and duplicate records. To address these issues, structured spreadsheet data can be imported into ServiceNow and automatically transferred to the required target table.

1.3 Project Idea

The proposed solution is to use ServiceNow Import Sets and Transform Maps to import employee information from an Excel spreadsheet. The Import Set acts as a staging area for incoming data, while the Transform Map defines how the source data is mapped and transferred to the target table.

1.4 Why This Idea Was Selected

- Represents a practical and realistic ServiceNow administration use case.
- Reduces the need for manual employee record creation.
- Provides a structured source-to-target data mapping process.
- Supports duplicate handling through the Coalesce configuration.
- Enables validation of inserted and updated employee records.
- Provides a foundation for extending the solution with reports and dashboards.

1.5 Expected Outcome

The expected outcome is a functional employee data import process in which spreadsheet records are successfully loaded into ServiceNow, transformed according to the configured mapping, and stored in the Employee Test table. The process should also handle repeated data appropriately to avoid unnecessary duplicate records.

1.6 Project Scope

The project scope covers the import of employee data from a spreadsheet into ServiceNow. It includes spreadsheet data preparation, creation of a custom target table, creation of an Import Set table, Transform Map configuration, field mapping, data transformation, Coalesce configuration, validation, report creation, and dashboard creation.

1.7 Project Objectives

- Understand how external spreadsheet data can be imported into ServiceNow.
- Create a custom Employee Test target table.
- Create an Import Set table to stage incoming employee records.
- Configure a Transform Map between the source and target tables.
- Map employee fields accurately from the source data to the target table.
- Transform and validate imported employee records.
- Prevent unnecessary duplicate records by using Coalesce.
- Create reports for employee, department, and location information.
- Present the generated reports through a centralized dashboard.

1.8 Initial Data Concept

The initial employee data concept identifies the key fields required for importing and managing employee records in ServiceNow.

Field	Purpose
Employee ID	Unique employee identifier.
Employee Name	Stores the employee's name.
Email	Stores the employee's email information.
Department	Identifies the employee's department.
Location	Identifies the employee's location.
