

IMPORT DATA USING TRANSFORMS MAPS (SPREADSHEET)

PHASE 2 – REQUIREMENT ANALYSIS

2.1 Introduction

Requirement analysis identifies the functional, data, platform, and reporting requirements needed to implement the project successfully. The analysis defines the source data, target table, required fields, ServiceNow capabilities, validation requirements, and reporting requirements.

2.2 Functional Requirements

- The system shall accept employee data from a spreadsheet.
- The imported data shall be stored in an **Import Set table**.
- The system shall provide an **Employee Test target table**.
- **Source fields shall be mapped** to the corresponding target fields.
- The **Transform Map** shall transform the imported data.
- **Coalesce** shall identify existing employee records and prevent unnecessary duplicates.
- New employee records shall be **inserted**, and matching records shall be **updated**.
- The system shall support reports and a centralized dashboard.

2.3 Data Requirements

The source spreadsheet must contain structured employee information. The project uses Employee ID, Employee Name, Email, Department, and Location as the core employee fields. The spreadsheet must be organized with the first row serving as the header row so that the data can be imported correctly.

2.4 Platform Requirements

- A ServiceNow instance with access to tables and Import Sets.
- Access to Application Navigator and the relevant administration modules.
- A spreadsheet file containing employee data.
- Permission to create a custom table and its required fields.
- Permission to create Transform Maps and Field Maps.
- Permission to create reports and dashboards.

2.5 Non-Functional Requirements

Requirement	Description
Accuracy	Imported employee information should correspond to the source spreadsheet.
Consistency	The same employee identifier should represent the same employee record.
Reliability	The transformation should complete successfully and provide a clear status.
Usability	Reports and dashboards should present the information in an easy-to-understand format.
Maintainability	The mapping and configuration should be understandable and reusable.
Data Integrity	Duplicate employee records should be avoided through suitable record matching.

2.6 Target Table Requirement

A custom table named Employee Test is created with the backend name `u_employee_test`. The table serves as the final destination for employee records after the transformation process.

2.7 Import Set Requirement

An Import Set table named Employee Import is created with the backend name `u_employee_import`. The table receives and temporarily stores the spreadsheet data before it is processed by the Transform Map.

2.8 Transform Map Requirement

The Transform Map is named Sample Spreadsheet Import. Its source table is Employee Import, and its target table is Employee Test. The project uses Auto Map Matching Fields and Mapping Assist to establish the required source-to-target field relationships.

2.9 Reporting Requirements

The project requires three reports to present employee information in structured formats:

- Employees by Department
- Employees by Location
- Employee List Report

The project also requires an Employee Analytics Dashboards dashboard to display the reports together in a centralized view.
