

IMPORT DATA USING TRANSFORM MAPS (SPREADSHEET)

PHASE 5 – PROJECT DEVELOPMENT

5.1 Introduction

The development phase is the main implementation stage of the project. The project is developed within ServiceNow according to the defined design and plan. The development process begins with preparing the spreadsheet and continues through table creation, data loading, transformation, and reporting.

5.2 Preparing the Spreadsheet

1. Open a new Google Spreadsheet.
2. Create sample employee data using the required fields.
3. Ensure that the first row contains the column headers.
4. Review the employee records for consistency.
5. Download the spreadsheet in Excel (.xlsx) format.

5.3 Creating the Employee Test Table

Navigate to Tables and select Create New.

- Table Label: Employee Test
- Backend Name: u_employee_test

5.4 Creating Employee Fields

Create the following fields in the Employee Test table:

- Employee ID – String
- Employee Name – String
- Email – String

- Department – String
- Location – String

After creating the fields, save the form and verify that all fields are available on the Employee Test form.

5.5 Creating the Import Set Table

The next development step is to create the staging table used to receive the spreadsheet data. In the Application Navigator, use the Load Data function to create the Import Set table.

- Import Set Label: Employee Import
- Backend Name: u_employee_import

5.6 Loading Spreadsheet Data

1. Open Load Data.
2. Select the spreadsheet file as the data source.
3. Select the required sheet.
4. Use the first row as the header row.
5. Submit the import.
6. Verify that the Import Set completes successfully.

5.7 Importance of the Staging Area

The Import Set table provides a controlled intermediate location for incoming data. Instead of sending spreadsheet values directly to the final employee table, the data first enters the staging area and can then be transformed according to the configured rules.

5.8 Creating the Transform Map

The Transform Map is the main configuration that controls how data is transferred from Employee Import to Employee Test.

Transform Map Name: Sample Spreadsheet Import

Property	Configured Value
Name	Sample Spreadsheet Import
Source Table	Employee Import
Target Table	Employee Test
Mapping Method	Auto Map Matching Fields / Mapping Assist

5.9 Field Mapping

Field mapping ensures that each incoming value is stored in the corresponding target field.

Field Mappings:

- Employee ID → Employee ID
- Employee Name → Employee Name
- Email → Email
- Department → Department
- Location → Location

5.10 Executing the Transformation

1. Open the configured Transform Map.
2. Review the source and target mappings.
3. Select Transform.
4. Execute the transformation.
5. Verify the success message.
6. Open Employee Test and verify the created records.

5.11 Enabling Coalesce

1. Open the Transform Map.
2. Open the Field Maps related list.
3. Select the field used to identify an employee.
4. Set Coalesce = True.
5. Save the Transform Map.
6. Import another spreadsheet containing existing and new employee data.

Coalesce allows matching records to be updated instead of inserting duplicate records.

5.12 Creating Reports

Report 1 – Employees by Department

- Table: Employee Test
- Chart: Pie Chart
- Group By: Department
- Aggregation: Count

Report 2 – Employees by Location

- Table: Employee Test
- Chart: Bar Chart
- Group By: Location
- Aggregation: Count

Report 3 – Employee List Report

The List report displays:

- Employee ID
- Employee Name
- Email

- Department
- Location

5.13 Creating the Employee Analytics Dashboard

1. Open All menus and search for Dashboards.
2. Open the Dashboards module.
3. Create a new dashboard.
4. Enter the dashboard name Employee Analytics Dashboards.
5. Save the dashboard.
6. Open each previously created report.
7. Select Share → Add to Dashboards.
8. Select Employee Analytics Dashboards.
9. Add the report.
10. Repeat the process for the remaining reports.

5.14 Development Outcome

The development phase produces a complete working workflow in which employee spreadsheet data can be imported, transformed into the target table, protected against duplicate insertion through Coalesce, and presented using reports and a dashboard.
