

IMPORT DATA USING TRANSFORM MAPS (SPREADSHEET)

PHASE 6 – PROJECT TESTING

6.1 Introduction

Testing verifies whether the implemented project functions as expected. The testing process focuses on successful data transformation, correct record creation, duplicate prevention, update behaviour, ignored records, and report output.

6.2 Initial Import Test

The first test uses the original spreadsheet. After the transformation is completed, the Employee Test table is checked to confirm that the imported employee records have been created successfully.

6.3 Data Verification

The imported records are verified by checking the following fields:

- Employee ID values
- Employee names
- Email values
- Departments
- Locations
- Target records against the source spreadsheet

6.4 Coalesce Test

A second spreadsheet is prepared containing four rows:

- Two rows represent existing Employee IDs with changed names or email values.
- Two rows contain new Employee IDs.

This test verifies that the Transform Map can distinguish existing employees from new employees.

6.5 Expected Coalesce Behaviour

Input Record	Expected Action
Existing Employee ID + changed values	Update existing record
New Employee ID	Insert new record
Same existing data again	No unnecessary new record

6.6 Repeated Import Test

The same spreadsheet is uploaded again using the same Transform Map. This test verifies whether records that have already been processed are inserted again.

The project source records the result as 0 inserted, 0 updated, and 4 ignored for the repeated four-row import.

6.7 Transform History Verification

Transform History is used to inspect the transformation results. It provides information about the imported rows and their processing status.

6.8 Report Testing

- Open Employees by Department and confirm that department counts are displayed.
- Open Employees by Location and confirm that location counts are displayed.
- Open Employee List Report and confirm that the required columns are visible.
- Verify that the report data is retrieved from the Employee Test table.
- Check that the reports can be added to the dashboard.

6.9 Dashboard Testing

The dashboard is opened after all three reports have been added. Each report is checked to ensure that it is visible and displays the required employee information.

6.10 Testing Summary

Testing demonstrates the main functions of the project, including successful data import, correct transformation, update handling, duplicate prevention behaviour, ignored records, and visual reporting.
